Reviews

This published publication is excellent. This really is for all who statte there had not been a well worth studying. I am very happy to inform you that this is the very best ebook i have read through within my very own daily life and could be he greatest pdf for possibly.

Coronary artery disease (CAD), is a narrowing (stenosis) of one or more of the epicardial coronary arteries. It is most commonly due to the buildup of plaque (atherosclerosis), which impedes the ability of these blood vessels to deliver oxygenated blood to the heart muscle (myocardium). Revascularization of the stenotic vessel either by dilatation using a balloon (also known as angioplasty) or by using a bypass venous graft (also known as coronary bypass) are the most common methods to restore blood supply. Percutaneous coronary intervention (PCI) or angioplasty with stent deployment is currently the most commonly performed revascularization procedure for CAD. PCI has traditionally been based on qualitative and quantitative coronary angiography (visual inspection of the radiocontrast lumenogram and computer-based quantification, respectively), an imaging technique for visualizing the interior of blood vessels. While angiography is the standard technique for anatomic visualization of coronary arteries, it is not without limitations as it does not provide information about what is causing the narrowing or whether the narrowing seriously impedes blood flow. Several adjunctive intravascular diagnostic procedures and imaging techniques have been developed for the purpose of providing more detailed anatomic and hemodynamic information about lesions in coronary arteries. However, whether this additional information improves patient outcomes and whether this improvement outweighs any risks introduced by the additional procedure needs to be considered. Using criteria based on the AHRQ CER Methods Guide, we assessed the strength of evidence for major comparisons of interest, as follows: There is a moderate strength of evidence (drawn from one randomized controlled trial RCT and one nonrandomized study) that the adjunctive use of FFR during stenting, as compared with angiography alone, to decide whether an intermediate coronary lesion (50 to...
