(iii) To determine the vibrations about steady motion of a top on a perfectly rough plane. Let A denote the moment of inertia of the top about a line through its apex perpendicular to its axis of symmetry, and let θ denote the angle made by the axis with the vertical, M the mass of the top, and h the distance of its centre of gravity from its apex: then we have seen (71) that after ignoring the Eulerian angles ϕ and ψ , the angle θ is determined by solving the dynamical system defined by the kinetic potential $RA^2\dot{\theta}^2 - Mgh \cos \theta$, $J^2 \sin^2 \theta$ where a and b are constants depending on the initial circumstances of the motion. Let a, n , be the values...
